

EasyBuild tips

Installing Intel compilers with EasyBuild

The installation process of non-GNU compilers is very poorly documented, and it took months to find and gather the relevant information. Here it is.

Downloading the license file

EasyBuild will not be able to install Intel compilers without a proper license file from Intel. The first step is, by the time you register your product, that you ask for a license file. Here is how to proceed:

- <https://software.intel.com/en-us/articles/how-do-i-manage-my-licenses>
- <https://software.intel.com/en-us/articles/resent-license-file>

This step is blocking. Don't go any further until you get the license file.

Downloading Intel components

EasyBuild will only be able to install Intel components separately, which means you have to download each of them separately as well. The required components are:

- Intel C++ compiler
- Intel Fortran compiler
- Intel MPI
- Intel MKL

In addition, you have to download exactly the patch level required by EasyBuild. To discover it, just run e.g. `eb intel-2017a.eb -r` once and extract the correct version number from EasyBuild's output:

```
== FAILED: Installation ended unsuccessfully (build directory: ...: build
failed (first 300 chars):
Couldn't find file
**parallel_studio_xe_2017_update1_composer_edition_for_cpp.tgz** anywhere,
and
downloading it didn't work either... Paths attempted (in order): ...
```

In our example, you have to download the components for version 2017 Update 1.

Making Intel components accessible to EasyBuild

The components you just downloaded are not visible to EasyBuild by default. We will suppose here that you stored them all in `/home/user/intel/easybuild/`. What you have to do is to create symbolic links within the EasyBuild hierarchy to this directory, naming each link after the package it stands for.

If you have told EasyBuild to install packages in e.g. `/home/user/hpc/`, you have to go to the `/home/user/hpc/sources/i/` subdirectory and create the links there:

```
cd /home/user/hpc/sources/i
ln -s /home/user/intel/easybuild icc
ln -s /home/user/intel/easybuild ifort
ln -s /home/user/intel/easybuild imkl
ln -s /home/user/intel/easybuild impi
```

Once done, EasyBuild will be able to use the downloaded files as source packages to install the Intel toolchain.
